

METHOD AND SYSTEM FOR CALL ANSWER WHILE
CONNECTED TO VOICE MAIL

ABSTRACT OF THE DISCLOSURE

5 A method and system for call answer while connected
to voice mail includes generating real-time packets for
transmission of a message toward a voice mail system.
Generation of the real-time packets is interrupted upon a
call answer by a party generating the message.
Generation of the real-time packets for transmission of
the message toward the voice mail system is resumed after
a delay associated with the call answer. An indication
10 is provided to the voice mail system that the real-time
packets generated subsequent to the delay follow the
real-time packets generated prior to the delay in the
message by a time amount less than the delay.
